SCI7661 series
SCI7654 series
POWER SUPPLY IC

2.

DC/DC Converter
& Voltage Regulator

DESCRIPTION

The SCI7661 Series is a highly effecient CMOS DC/
DC converter for doubling or tripling an input voltage.
It incorporates an on-chip voltage regulator to ensure
stable output at the specified voltage. The SCI7661 Se-
ries offers a choice of three, optional temperature gradi-
ents for applications such as LCD panel power supplies.
The SCI7661C0B is available in 14-pin plastic DIPs, the
SCI7661M0B, in 14-pin plastic SOPs, and the
SCI7661MBB in 16-pin plastic SSOPs.

FEATURES

• 95% (Typ.) conversion efficiency
• Up to four output voltages, V_O, relative to the input
  voltage, V_I
• On-chip voltage regulator
• 20mA maximum output current at $V_I = -5V$
• Three temperature gradients—0.1, 0.4 and 0.6%/°C
• External shut-down control
• 2µA maximum output current when shut-down
• Two-in-series configuration doubles negative output
  voltage.
• On-chip RC oscillator
• SCI7661C0B .... pladtic DIP-14 pin
  SCI7661M0B .... pladtic SOP5-14 Pin
 SCI7661MBB .... pladtic SSOP2-16 pin

APPLICATIONS

• Power supplies for LCD panels
• Fixed-voltage power supplies for battery-operated
  equipment
• Power supplies for pagers, memory cards, calculators
  and similar hand-held equipment
• Fixed-voltage power supplies for medical equipment
• Fixed-voltage power supplies for communications
  equipment
• Power supplies for microcomputers
• Uninterruptable power supplies

			VI	8	9 VO

PIN DESCRIPTION

Number	Name	Description
1	CAP1+	Positive charge-pump connection for $\times 2$ multiplier
2	CAP1−	Negative charge-pump connection for $\times 2$ multiplier
3	CAP2+	Positive charge-pump connection for $\times 3$ multiplier
4	CAP2−	Negative charge-pump connection for $\times 3$ multiplier or $\times 2$ multiplier output
5	TC1	Temperature gradient selects
6	TC2	
7	VI	Negative supply (system ground)
8	VO	$\times 3$ multiplier output
9	VREG	Voltage regulator output
10	RV	Voltage regulator output adjust
11	$\overline{POFF}$	Voltage regulator output ON/OFF control
12	OSC2	Resistor connection. Open when using external clock
13	OSC1	Resistor connection. Clock input when using external clock
14	VDD	Positive supply (system VCC)

SPECIFICATIONS

Absolute Maximum Ratings

Items	Codes	Ratings	Units	Remarks
Input supply voltage	$V_I - V_{DD}$	$-20/N$ to $V_{DD} + 0.3$	V	N = 2: Boosting to a double voltage N = 3: Boosting to a triple voltage
Input terminal voltage	$V_I - V_{DD}$	$V_I - 0.3$ to $V_{DD} + 0.3$	V	OSC1, OSC2, $\overline{POFF}$
		$V_O - 0.3$ to $V_{DD} + 0.3$	V	TC1, TC2, RV
Output voltage	$V_O - V_{DD}$	-20 to $V_{DD} + 0.3$	V	V_O　　　　　　　Note 3)
		V_O to $V_{DD} + 0.3$	V	V_{REG}　　　　　Note 3)
Allowable dissipation	Pd	Max. 300	mW	
Working temperature	Topr	-40 to 85	°C	Plastic package
Storage temperature	Tstg	-55 to 150	°C	
Soldering temperature and time	Tsol	260°C 10 s (at leads)	–	

Notes

1. Using the IC under conditions exceeding the aforementioned absolute maximum ratings may lead to permanent destruction of the IC. Also, if an IC is operated at the absolute maximum ratings for a longer period of time, its functional reliability may be substantially deteriorated.
2. All the voltage ratings are based on $V_{DD} = 0V$.
3. The output terminals (V_O, V_{REG}) are meant to output boosted voltage or stabilized boosted voltage. They, therefore, are not the terminals to apply an external voltage. In case the using specifications unavoidably call for application of an external voltage, keep such voltage below the voltage ratings given above.
Reconmmended Operating Conditions
$V_{DD} = 0V$, Ta = -40 to 85°C unless otherwise noted

Parameter	Symbol	Conditions	Rating			Unit
			Min.	Typ.	Max.	
Oscillator startup voltage	V_{STA}	$R_{OSC} = 1M\Omega$ $C_3 = 10~\mu F$, $C_L/C_3 \leq 1/20$, Ta = -40 to 85°C. See note 1.	–	–	-1.8	V
		$R_{OSC} = 1M\Omega$	–	–	-2.2	
Oscillator shutdown voltage	V_{STP}	$R_{OSC} = 1M\Omega$	-1.8	–	–	V
Load resistance	R_L		R_L min. See note 2.	–	–	Ω
Output current	Io		–	–	20.0	mA
Clock frequency	fosc		10.0	–	30.0	kHz
RC oscillator network resistance	R_{OSC}		680	–	2,000	kΩ
Capacitance	C_1, C_2, C_3		3.3	–	–	μF
Stabilization voltage sensing resistance	R_{RV}		100	–	1,000	kΩ

Notes

1. The recommended circuit configuration for low-valtage operation (when V_I is between $-1.2V$ and $-2.2V$) is shown in the following figure. Note that diode D1 should have a maximum forward voltage of 0.6V with 1.0mA forward current.
2. R_L min can be varied depending on the input voltage.

DC/DC Converter
& Voltage Regulator

3. R_L min is a function of V_1

Electrical Characteristics

$V_{DD} = 0V$, $V_1 = -5V$, $Ta = -40$ to $85°C$ unless otherwise noted

Parameter	Symbol	Conditions	Rating			Unit
			Min.	Typ.	Max.

Temperature Gradient Control

The SCI7661C0B offers a choice of three temperature gradients which can be used to adjust the voltage regulator output in applications such as power supplies for driving LCDs.

| $\overline{\text{POFF}}$	TC2	TC1	Temperature gradient (%/°C) See note 2.	Voltage regulator output	RC osciliator	Remarks
	See note 1.					
1 (V_{DD})	LOW (V_O)	LOW (V_O)	−0.4	ON	ON	
1	LOW	HIGH (V_{DD})	−0.1	ON	ON	
1	HIGH (V_{DD})	LOW	−0.6	ON	ON	
1	HIGH	HIGH	−0.6	ON	OFF	Serial connection
0 (V_1)	LOW	LOW	−	OFF (high impedance)	OFF	
0	LOW	HIGH	−	OFF (high impedance)	OFF	
0	HIGH	LOW	−	OFF (high impedance)	OFF	
0	HIGH	HIGH	−	OFF (high impedance)	OFF	Multiplier operational

Notes
1. The definition of LOW for $\overline{\text{POFF}}$ differs from that for TC1 and TC2.
2. The temperature gradient affects the voltage between V_{DD} and V_{REG}.

EPSON

# FUNCTIONAL DESCRIPTION

Oscillator

The on-chip RC oscillator network frequency is determined by the external resistor, R_{OSC}, connected between OSC1 and OSC2. This oscillator can be disabled in favor of an external clock by leaving OSC2 open and applying an external clock signal to OSC1.
Oscillator   External clock

OSC1   OSC1

R_{OSC} External clock signal

OSC2   OSC2

Reference Volatge Generator and Voltage Regulator

The reference voltage generator supplies a reference voltage to the voltage regulator to control the output. This voltage can be switched ON and OFF.

V_{DD}

$\overline{POFF}$ Control signal

RV R_{RV} = 100 kΩ to 1 MΩ
V_{REG}

Voltage Multiplier

The voltage multiplier uses the clock signal from the oscillator to double or triple the input voltage. This requires three external capacitors–two charge-pump capacitors between CAP1+ and CAP1– and CAP2+ and CAP2–, respectively, and a smoothing capacitor between V_I and V_O.

V_{DD} = 0 V

V_I = –5 V

V_O = $3V_I$ = –15 V

DC/DC Converter & Voltage Regulator
TYPICAL APPLICATIONS
Voltage Tripler with Regulator
The following figure shows the circuit required to triple the input voltage, regulate the result and add a temperature gradient of –0.4%/°C. Note that the high input impedance of RV requires appropriate noise countermeasures.
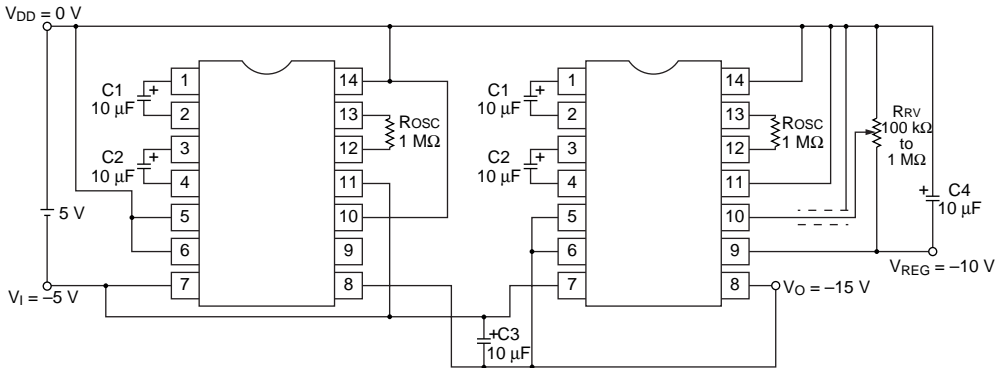

Converting a Voltage Tripler to a Voltage Doubler
To convert this curcuit to a voltage doubler, remove capacitor C2 and short circuit CAP2– to Vo.

Parallel Connection
Connecting two or more chips in parallel reduces the output impedance by $1/n$, where n is the number of devices used.

Only the single output smoothing capacitor, C3, is required when any number of devices are connected in parallel. Also, the voltage regulator in one chip is sufficient to regulate the combined output.

Serial Connection

Connecting two or more chips in series obtains a higher output voltage than can be obtained using a parallel connection, however, this also raises the output impedance.

<Precautions when connecting loads>

In case of series connections, when connecting loads between the first stage VDD (or other potential of the second stage VDD or up) and the second stage VREG as shown in Fig. 2-13, be cautions about the following point.

* When normal output is not occurring at the VREG terminal such as at times of starting up or when turning the VREG off by Poff signals, if current flows into the second stage VREG terminal through the load from the first stage VDD (or other potential of the second stage VDD or up) to cause a voltage exceeding the absolute maximum rating for the second stage VDD at the VREG terminal, normal operation of the IC may be hampered. Consequently, When making a series connection, insert a diode D1 between the second stage VI and VREG as shown in Fig. 2-13 so that a voltage exceeding the second stage VDD or up may not be applied to the VREG terminal.

Positive Voltage Conversion

Adding diodes converts a negative voltage to a positive one.

To convert the voltage tripler shown earlier to a voltage doubler, remove C2 and D2, and short circuit D3. Small Schottky diodes are recommended for all three diodes. The resulting voltage is lowered by V_F, the voltage drop in the forward direction for each diode used. For example, if $V_{DD} = 0V$, $V_I = -5V$, and $V_F = 0.6V$, the resulting voltages would be as follows.

* For a voltage tripler,
  $V_O = 10 - (3 \times 0.6) = 8.2V$
* For a voltage doubler,
 $V_O = 5 - (2 \times 0.6) = 3.8V$
